Simulation and Optimization of Internal Combustion Engines Zhiyu Han, 2021-12-28

Simulation and Optimization of Internal Combustion Engines provides the fundamentals and up to date progress in multidimensional simulation and optimization of internal combustion engines. While it is impossible to include all the models in a single book, this book intends to introduce the pioneer and or the often used models and the physics behind them, providing readers with ready to use knowledge. Key issues, useful modeling methodology and techniques as well as instructive results are discussed through examples. Readers will understand the fundamentals of these examples and be inspired to explore new ideas and means for better solutions in their studies and work. Topics include combustion basis of IC engines, mathematical descriptions of reactive flow with sprays, engine in cylinder turbulence, fuel sprays, combustions and pollutant emissions, optimization of direct injection gasoline engines and optimization of diesel and alternative fuel engines.

Mixture Formation in Internal Combustion Engines Carsten Baumgarten, 2006-09-28 A systematic control of mixture formation with modern high pressure injection systems enables us to achieve considerable improvements of the combustion process in terms of reduced fuel consumption and engine out raw emissions. However, because of the growing number of free parameters due to more flexible injection systems, variable valve trains, the application of different combustion concepts within different regions of the engine map etc, the prediction of spray and mixture formation becomes increasingly complex. For this reason, the optimization of the in cylinder processes using 3D computational fluid dynamics (CFD) becomes increasingly important. In these CFD codes, the detailed modeling of spray and mixture formation is a prerequisite for the correct calculation of the subsequent processes like ignition, combustion and formation of emissions. Although such simulation tools can be viewed as standard tools today, the predictive quality of the sub models is constantly enhanced by a more accurate and detailed modeling of the relevant processes and by the inclusion of new important mechanisms and effects that come along with the development of new injection systems and have not been considered so far. In this book, the most widely used mathematical models for the

simulation of spray and mixture formation in 3D CFD calculations are described and discussed In order to give the reader an introduction into the complex processes the book starts with a description of the fundamental mechanisms and categories of fuel injection spray break up and mixture formation in internal combustion engines

Weaving,1990-05-31 Sir Diarmuid Downs CBE FEng FRS Engineering is about designing and making marketable artefacts The element of design is what principally distinguishes engineering from science The engineer is a creator He brings together knowledge and experience from a variety of sources to serve his ends producing goods of value to the individual and to the community An important source of information on which the engineer draws is the work of the scientist or the scientifically minded engineer The pure scientist is concerned with knowledge for its own sake and receives his greatest satisfaction if his experimental observations fit into an aesthetically satisfying theory The applied scientist or engineer is also concerned with theory but as a means to an end He tries to devise a theory which will encompass the known experimental facts both because an all embracing theory somehow serves as an extra validation of the facts and because the theory provides us with new leads to further fruitful experimental investigation I have laboured these perhaps rather obvious points because they are well exemplified in this present book The first internal combustion engines produced just over one hundred years ago were very simple the design being based on very limited experimental information The current engines are extremely complex and while the basic design of cylinder piston connecting rod and crankshaft has changed but little the overall performance in respect of specific power fuel economy pollution noise and cost has been absolutely transformed
