Protein Synthesis

Proteins are the building blocks of life. They are made of amino acids and are found in every cell. They are responsible for many of the functions of the cell, such as catalyzing chemical reactions, providing structural support, and transporting molecules.

Structure of a Protein

Proteins are made of long chains of amino acids. The sequence of amino acids in a protein determines its structure and function. The structure of a protein is determined by the sequence of amino acids and the interactions between the amino acids.

Protein Synthesis

Protein synthesis is the process of making proteins. It occurs in the ribosomes of the cell. The process involves the transcription of DNA into messenger RNA (mRNA) and the translation of mRNA into a protein.

Transcription

Transcription is the first step in protein synthesis. It occurs in the nucleus of the cell. The DNA double helix is unwound, and one strand is used as a template to synthesize a complementary mRNA strand.

Translation

Translation is the second step in protein synthesis. It occurs in the cytoplasm of the cell. The mRNA strand is read by a ribosome, and the sequence of amino acids is determined by the sequence of codons on the mRNA.

Protein Folding

After a protein is synthesized, it must fold into its functional shape. This is determined by the sequence of amino acids and the interactions between the amino acids.

Protein Function

Proteins have a wide variety of functions. Some are enzymes that catalyze chemical reactions. Some are structural proteins that provide support. Some are transport proteins that carry molecules. Some are signaling proteins that transmit information.
