Excerpt Bicycle and motorcycle dynamics is the science of the motion of bicycles and motorcycles and their components due to the forces acting on them Dynamics is a branch of classical mechanics which in turn is a branch of physics Bike motions of interest include balancing steering braking accelerating suspension activation and vibration The study of these motions began in the late 19th century and continues today Bicycles and motorcycles are both single track vehicles and so their motions have many fundamental attributes in common and are fundamentally different from and more difficult to study than

other wheeled vehicles such as dicycles tricycles and quadracycles As with unicycles bikes lack lateral stability when stationary and under most circumstances can only remain upright when moving forward Experimentation and mathematical analysis have shown that a bike stays upright when it is steered to keep its center of mass over its wheels This steering is usually supplied by a rider or in certain circumstances by the bike itself Several factors including geometry mass distribution and gyroscopic effect all contribute in varying degrees to this self stability but long standing hypotheses and claims that any single effect such as gyroscopic or trail is solely
