Kamil,J.R. Krebs,H.R. Pulliam,2012-12-06 Foraging behavior has always been a central concern of ecology Understanding what animals eat is clearly an essential component of understanding many ecological issues including energy flow competition and adaptation Theoretical and empirical developments in the late 1960 s and 1970 s led to a new emphasis in the study of foraging behavior the study of individual animals in both field and laboratory This development in turn led to an explosion of interest in foraging Part of the reason for this explosion is that when foraging is studied at the individual level it is relevant to many disciplines Behaviorists including ethologists and psychologists are interested in any attempt to understand behavior Ecologists know that a better understanding of foraging will contribute to resolving a number of important ecological issues Anthropologists and others are applying the ideas coming out of the study of foraging behavior to problems within their disciplines These developments led to a multidisciplinary symposium on foraging behavior held as part of the 1978 Animal Behavior Society meetings in Seattle Washington Many ecologists ethologists and psychologists participated or attended The symposium was very successful generating a high level of excitement As a result the participants decided to publish the proceedings of the symposium Kami1 Sargent 1981

Ecological Explosions Daniel Simberloff, 2026-01-16 A leading biologist offers a comprehensive and accessible history of invasive species science from its earliest antecedents through its current research foci and controversies From the arrival of the naval shipworm in the Black Sea in the first millennium BC to the escape of the Burmese python in Florida in 1992 humans have moved species to new locations deliberately or inadvertently for thousands of years Agricultural and environmental impacts of some invasions were evident early although whether observers recognized that the cause was an introduced species is uncertain The history of invasion biology truly begins in the sixteenth through eighteenth centuries when explorers noticed European species on various distant islands and in North America In the nineteenth century biogeographers studying species distributions across the globe introduced the first native and non native species categorizations and prominent researchers like Charles Darwin began to describe the impacts of introduced species In the nineteenth and twentieth centuries as humans moved increasing numbers of species across the globe the advent of modern ecology deepened our understanding of the scope of the problem In *Ecological Explosions* invasive species expert Daniel Simberloff provides a thorough overview of the development of invasion science from early research including from the perspectives of leading scientists like Aldo Leopold to the field s future Simberloff explores the work of pioneering ecologists like Charles Elton antecedents of what became today s invasion biology before discussing the field s true emergence in the 1980s its explosive methodological and theoretical expansion its integration with other disciplines and its

increasing visibility not only within the biological literature but also in government policies across the world in the 1990s
Finally he investigates current controversies such as the debate over whether the entire science is xenophobic and asks how ecosystems might adapt to a rapidly globalizing world and ever increasing numbers of introduced species including the joro spider lionfish spotted lanternfly common reed and Asian carp
