Abstract *Solanum pimpinellifolium*, due to its close relationship to *S. lycopersicum*, has been a genetic source for many commercially important tomato traits. It is a wild species found in the coastal areas of Peru and Ecuador. In this study, the genetic variation of *S. pimpinellifolium* was studied using the diversity found in 10 microsatellites in 248 plants spread throughout its entire distribution area, including Ecuador, which has been underrepresented in previous studies. Peruvian and Ecuadorian accessions are genetically quite differentiated. A possible cause of these differences could be the non-uniform nature

of the coastal Ecuadorian and Peruvian climates, seeing as an important correlation between genetic differentiation and climate has been found. In addition, Ecuadorian and south Peruvian accessions have a lower genetic diversity and a higher homozygosity due to their higher autogamy, lower population size, and possible colonization bottlenecks. The Galápagos Islands population is an extreme case, with no diversity, likely caused by a recent colonization from the northern continental Ecuadorian region where genetically identical plants have been found.

Introduction

Solanum pimpinellifolium L. is a small perennial bush common in the coastal areas of Peru and Ecuador. In central and southern Peru, *S. pimpinellifolium* is restricted to cultivated fields, roadsides and dumping grounds, and its distribution is sparse; but in Ecuador and northern Peru, it is found in dense populations located in undisturbed areas (Rick et al. 1977; Caicedo and Schall 2004). The former name of this species, *Lycopersicon pimpinellifolium* (L.) Mill., has been changed because recent studies, based on molecular data, have classified the genus *Lycopersicon* (Miller
