- 1 data scientists that utilize and develop DL algorithms in partnership with domain experts such as medical economic or climate scientists
- 2 hardware designers that develop specialized hardware to accelerate the components in the DL models and
- 3 performance and compiler engineers that optimize software to run more efficiently on a given hardware

Hardware engineers should be aware of the characteristics and components of production and academic models likely to be adopted by industry to guide design decisions impacting future hardware Data scientists should be aware of deployment platform constraints when designing models Performance engineers should support optimizations across diverse models libraries and hardware targets The purpose of this book is to provide a solid understanding of

- 1 the design training and applications of DL algorithms in industry
- 2 the compiler techniques to map deep learning code to hardware targets and
- 3 the critical hardware features that accelerate DL systems

This book aims to facilitate co innovation for the advancement of DL systems It is written for engineers working in one or more of these areas who seek to understand the entire system stack in order to better collaborate with engineers working in

other parts of the system stack The book details advancements and adoption of DL models in industry explains the training and deployment process describes the essential hardware architectural features needed for today s and future models and details advances in DL compilers to efficiently execute algorithms across various hardware targets Unique in this book is the holistic exposition of the entire DL system stack the emphasis on commercial applications and the practical techniques to design models and accelerate their performance The author is fortunate to work with hardware software data scientist and research teams across many high technology companies with hyperscale data centers These companies employ many of the examples and methods provided throughout the book
