

Origin of the Earth

The Earth probably formed from material in the solar nebula—the cloud of gas and dust that led to the formation of the Sun. This material gradually grew into a larger and larger body that became a red-hot ball of rock and metal. Later the rocky crust formed, its surface cooling enough to allow the continents to appear. Even later the oceans arrived, as well as the tiny organisms that released oxygen into the atmosphere. Although much of this gas was initially consumed in chemical reactions, over time, it allowed the development of multicellular organisms and an explosion of life that took place at the start of the Paleozoic Era, 542 million years ago.

Continental Drift

Over time the continents, which are part of massive plates that drift across the Earth's surface at the rate of a fingernail's growth, 1/32 inch per year, have shifted, broken up, and reformed over part of the planet's history. When tectonic plates are pushed together, they can push together and submerge one under the other, or they can separate and create a rift basin. The rift basin enlarges and can eventually fill with water to form a sea that eventually becomes the site for the birth of a new ocean basin. When plates drift apart, a process called continental rifting, they create a rift basin for water to fill. Over time, the rift basin can become a new ocean basin, separating at the time of rifting.

1 450 MILLION YEARS AGO
The supercontinent Gondwana formed as continents merged together.

2 350 MILLION YEARS AGO
The Tethyan Sea forms with Europe, creating two continents, leading to forests and flowers.

3 250 MILLION YEARS AGO
Continents split, forming two major landmasses at the northern and southern poles.

Origin of the Earth

The Earth was formed 4.5 billion years ago from a cloud of dust and gas. In the beginning, it was a molten, scorching sphere made of fire. Over time, the clouds began to cool, and the atmosphere began to form as the Earth cooled to form.

Chronology

Chronology is the study of time in the Earth's past. It includes the study of fossils and other evidence to determine the age of rocks and the sequence of events in the Earth's history.

Through the study of fossils, evidence of ancient life in the Earth's past is uncovered. Fossils are the remains of plants and animals that lived in the past.

Tectonic Plates

The surface of the Earth is composed of tectonic plates. These are rigid upper plates, some of which can move relative to each other. The plates' boundaries are marked by major features, such as mountains, volcanoes, and deep-sea trenches.

- Mid-ocean ridge** - where two plates move apart
- Transform fault** - where two plates slide past each other
- Subduction zone** - where one plate moves under another
- Hot spot** - where magma rises from the mantle
