SNAP-8 Refractory Boiler Development Program R. A. Fuller,1974 Performance and endurance tests of the SNAP 8 SN 1 refractory metal boiler are described The tests were successful and indicated that the boiler heat transfer area could be reduced significantly primarily because of the wetting characteristics of mercury on tantalum in a contaminant free environment A continuous endurance test of more than 10 000 hours was conducted without noticeable change in the thermal performance of the boiler A conclusion of the metallographic examination of the boiler following the endurance test was that expected boiler life would be of the order of 40 000 hours at observed corrosion rates
