## **Rotating Fields In General Relativity:**

*Rotating Fields in General Relativity* Jamal Nazrul Islam, 2009-06-18 The aim of this book is to introduce the reader to research work on a particular aspect of rotating fields in general relativity The account begins with a short introduction to the relevant aspects of general relativity written at a level accessible to a beginning graduate student in theoretical physics There follows a detailed derivation of the Wehl Lewis Papapetrou form of the stationary axially symmetric metric The Kerr and Tomimatsu Sato forms of the rotating interior and exterior solutions of the Einstein equations are then discussed The last three chapters of the book illustrate the applications of the theory to rotating neutral dust rotating Einstein Maxwell fields and rotating charged dust The author has drawn on his own research work to produce a timely discussion of this important area of research

*The Rotating Fields in General Relativity* Shohel Ahmed, 2019-05-16 The black holes of nature are the most perfect macroscopic objects there are in the universe the only elements in there that constructed our concept of space and time Black holes are a class of gravitational objects predicted by Einstein s theory of general relativity given by him in 1915 And since the general theory of relativity provides only a single unique family of solutions for their descriptions they are the simplest objects as well Due to the gravitational effects on space time its most striking property is that there is a region of space around a black hole where light is unable to escape The unique two parameter family of solutions which describes the space time around black hole is the Kerr family discovered by Roy Patrick Kerr in July 1963 The two parameters are the mass and the angular momentum of the black holes The static solution with zero angular momentum was discovered by Karl Schwarzschild in December 1915 A study of the black holes of nature is then a study of these solutions It is to this study that this book is devoted

**Relativistic Geodesy** Dirk Puetzfeld, Claus Lämmerzahl, 2019-02-09 Due to steadily improving experimental accuracy relativistic concepts based on Einstein s theory of Special and General Relativity are playing an increasingly important role in modern geodesy This book offers an introduction to the emerging field of relativistic geodesy and covers topics ranging from the description of clocks and test bodies to time and frequency measurements to current and future observations Emphasis is placed on geodetically relevant definitions and fundamental methods in the context of Einstein s theory e g the role of observers use of clocks definition of reference systems and the geoid use of relativistic approximation schemes Further the applications discussed range from chronometric and gradiometric determinations of the gravitational field to the latest satellite experiments The impact of choices made at a fundamental theoretical level on the interpretation of measurements and the planning of future experiments is also highlighted Providing an up to the minute status report on the respective topics discussed the book will not only benefit experts but will also serve as a guide for students with a background in either geodesy or gravitational physics who are interested in entering and exploring this emerging field

Astronomy and Astrophysics Abstracts aims to present a comprehensive documentation of the literature concerning all aspects of astronomy, astrophysics and their border fields. It is devoted to the recording, summarizing and indexing of the relevant publications throughout the world. Astronomy and Astrophysics Abstracts is prepared by a special department of the Astronomisches Rechen Institut under the auspices of the International Astronomical Union. Volume 40 records literature published in 1985 and received before February 15, 1986. Some older documents which we received late and which are not surveyed in earlier volumes are included too. We acknowledge with thanks contributions of our colleagues all over the world. We also express our gratitude to all organizations, observatories and publishers which provide us with complimentary copies of their publications. Starting with Volume 33 all the recording, correction and data processing work was done by means of computers. The recording was done by some technical staff members: Ms Helga Ballmann, Ms Mona El Choura, Ms Monika Kohl, Ms Sylvia Matyssek, Ms Karirr Burkhardt, Ms Susanne Schlichtberg, Mr Martin Schlichtberg and Mr Stefan Wagner supported the task by careful proof reading. It is a pleasure to thank them all for their encouragement.

Francisco Javier Chinea, 1993. This book addresses physicists working in general relativity, astrophysics and cosmology. The contributions are based on reports given at a summer school, the goal of which was to review modern research for students. The school was centered on the study of gravitational fields corresponding to rotating objects of astrophysical interest under different viewpoints: theoretical, numerical and observational. Special emphasis is put on the analysis of interior and exterior fields of stationary axisymmetric systems. Lectures and contributions collected here in Part I ranged from basic information useful to newcomers to technical points pertaining to current research in this area. Part II contains lectures and contributions on other aspects of gravitation theory.

**Lorentzian Wormholes**, Matt Visser, 1995. Drawing on pivotal work by Einstein, Wheeler, Thorne, Hawking and others, Matt Visser charts the development and current state of Lorentzian wormhole physics. Dr. Visser shows that by pushing established physical theories to their limits, it is possible to deduce the true physics of such exotica as wormholes and time travel. The physical framework he uses is derived from one of the major research frontiers of modern theoretical physics: quantum gravity, the intersection of classical Einstein gravity and quantum field theory.

About the Author: Matt Visser is Research Assistant Professor at Washington University, St. Louis. He has lectured in the United States and abroad on topics including wormhole physics, time travel and the chronology protection conjecture. He has conducted postdoctoral research at both the University of Southern California and at Los Alamos National Laboratory.
