

## Chapter 10: Endocrine System Anatomy and Physiology

### Endocrine System Glands

### Cell Secretion Types

#### Autocrine

- released by cells and have local effect on same cell type
- Example - eicosanoids

#### Paracrine

- released by cells that affect other cell types in close proximity
- Example - somatostatin

#### Neurotransmitter and Neuromodulators

- secreted by nerve cells
- Example - nervous system function

#### Hormones and Neurohormones

- secreted into blood and bind to receptor sites
- Example - epinephrine and insulin

### Endocrine System Functions

- Metabolism
- Control of Food Intake and Digestion
- Tissue Development
- Ion Regulation
- Water Balance
- Heart rate and Blood pressure regulation
- Control of Blood Glucose and other nutrients

- Control of Reproductive Functions
- Uterine Contraction and Milk Release
- Immune System Regulation

- The target tissues have receptors for a specific hormone.
- Hormones produce a particular response in the target tissue.

### Characteristics

#### Water-soluble hormones:

- includes proteins, peptides, amino acids
- most common
- Examples - growth hormone, antidiuretic, prolactin

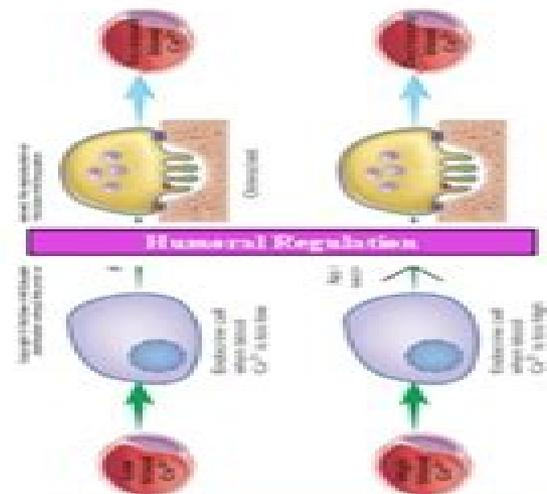

### Types of Hormones

- soluble in water
- eicosanoids
- Examples - LH, FSH, androgens

- Blood-borne chemicals can directly stimulate the release of some hormones.
- These chemicals are referred to as **humoral stimuli** because they circulate in the blood.

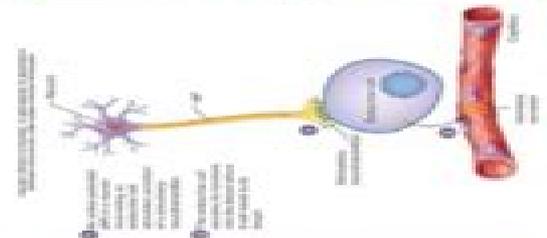

### Control of Hormone Release

- Hormone release can also be under **neural** control.
- Following action potentials, neurons release a neurotransmitter into the synapse with the cells that produce the hormone.
- Hormone release can also be controlled by other hormones.
- It occurs when a hormone is secreted that, in turn, stimulates the secretion of other hormones.
- The same three types of stimuli (humoral, neural, and hormonal) can stimulate or inhibit hormone release.

### Humoral Regulation

### Neural Regulation

### Inhibitors of Hormone Release

- Humoral inhibition** of hormone release generally involves the actions of companion hormones. Usually each of the companion hormones performs an opposite function.
- For example, to raise blood pressure, the adrenal cortex secretes the hormone aldosterone in response to low blood pressure, but to lower it the heart atria secrete atrial natriuretic peptide.
- They work together to maintain homeostasis of blood pressure.
- Neurons inhibit targets just as often as they stimulate targets.
