Stock Market Modeling and Forecasting Xiaolian Zheng, Ben M. Chen, 2013-04-05 *Stock Market Modeling and Forecasting* translates experience in system adaptation gained in an engineering context to the modeling of financial markets with a view to improving the capture and understanding of market dynamics The modeling process is considered as identifying a dynamic system in which a real stock market is treated as an unknown plant and the

identification model proposed is tuned by feedback of the matching error Like a physical system a financial market exhibits fast and slow dynamics corresponding to external such as company value and profitability and internal forces such as investor sentiment and commodity prices respectively The framework presented here consisting of an internal model and an adaptive filter is successful at considering both fast and slow market dynamics A double selection method is efficacious in identifying input factors influential in market movements revealing them to be both frequency and market dependent The authors present work on both developed and developing markets in the shape of the US Hong Kong Chinese and Singaporean stock markets Results from all these sources demonstrate the efficiency of the model framework in identifying significant influences and the quality of its predictive ability promising results are also obtained by applying the model framework to the forecasting of major market turning periods Having shown that system theoretic ideas can form the core of a novel and effective basis for stock market analysis the book is completed by an indication of possible and likely future expansions of the research in this area [New Tools for Stock Market Analysis](#) Nicolas Molodovsky,1947
