

ASTRONOMY LAB - Build a Telescope

Background

Telescopes have made it possible for man to explore space from right here on the ground (as well as from space). There are two main types of optical telescopes: refracting and reflecting.

Optical telescopes use the visible part of the electromagnetic spectrum, which is the type of light that we can actually see. Refracting telescopes were created in the early 1600's and were made famous by Galileo Galilei. They use two glass lenses to concentrate a distant object to the viewer.

Reflecting telescopes are also optical telescopes which use single or multiple mirrors that reflect light into the viewer. This improved the quality offered by refracting telescopes. They were invented in the mid-1600's, made famous by Sir Isaac Newton, and have improved in mirror and glass quality over the years. Almost all optical telescopes used today are reflecting telescopes.

The Challenge

Your task is to create a basic refracting telescope without a case. If time permits, you will try to create a reflecting telescope by adding a mirror. Since our telescope will not be inside a case, you will be able to move the pieces to learn the principles of what is happening inside both types of optical telescopes.
