Visual Intelligence Through Human Learning Ranjay Krishna,2021 At the core of human development is the ability to adapt to new previously unseen stimuli We comprehend new situations as a composition of previously seen information and ask one another for clarification when we encounter new concepts Yet this ability to go beyond the confounds of their training data remains an open challenge for artificial intelligence My research designs visual intelligence to reason over new compositions and acquire new concepts by interacting with people I draw on ideas from human learning from human cognition and human interaction to deliver representations training frameworks models evaluation protocols and interactions for computer vision My dissertation will explore some the challenges associated with existing vision methods and present the two following lines of work Drawing on human cognition I will introduce scene graphs a cognitively grounded compositional visual representation With the scene graph representation I will show that it possible for models to learn from a finite set of situations outlined in their training data and allows models to recognize new composition of previous seen concepts I will build scene graph models that can recognize new visual relationships with as few as 10 labels per relationship Finally I will demonstrate how scene graphs can be used to improve core computer vision tasks such as action recognition improving existing baselines with as few as 5 training examples Since our introduction of scene graphs the computer vision community has developed hundreds of scene graph models and utilized scene graphs to achieve state of the art results across multiple core tasks including object localization captioning image generation question answering 3D understanding and spatio temporal action recognition Drawing on human interaction I will introduce a framework for socially situated learning This framework pushes agents beyond traditional active learning paradigms and enables learning from human interactions in social environments Using this framework I will design a real world deployment of a socially situated agent our agent learns to acquire new concepts by asking people targeted questions on social media about the contents of the photos they upload By interacting with over 230K people over 8 months our agent learns to recognize hundreds of new concepts Finally To promote pro social human computer interactions I will demonstrate the importance of choosing appropriate metaphors to describe intelligent systems Together this dissertation exhibits the benefits of drawing on ideas from human learning to develop better visual intelligence My research connects ideas from cognitive science and social psychology with advances in computer vision natural language processing machine learning and human
