Air Pollution Riley Mitchell & Felix Sweeney, 2018-11-11 Air pollution occurs in many forms but can generally be thought of as gaseous and particulate contaminants that are present in the earth's atmosphere. Gaseous pollutants include sulfur dioxide (SO₂), nitrogen oxides (NO_x), ozone (O₃), carbon monoxide (CO), volatile organic compounds (VOC), hydrogen sulfide (H₂S), hydrogen fluoride (HF), and various gaseous forms of metals. These pollutants are emitted from large stationary sources such as fossil fuel-fired power plants, smelters, industrial boilers, petroleum refineries, and manufacturing facilities, as well as from area and mobile sources. They are corrosive to various materials, which causes damage to cultural resources, can cause injury to ecosystems and organisms, aggravate respiratory diseases, and reduce visibility. Air pollution injury to plants can be evident in several ways. Injury to foliage may be visible in a short time and appear as necrotic lesions, dead tissue, or it can develop slowly as a yellowing or chlorosis of the leaf. There may be a reduction in growth of various portions of a plant. Plants may be killed outright, but they usually do not succumb until they have suffered recurrent injury. Today's marketplace is increasingly dependent on satisfying a myriad of local environmental requirements, the demands of environmental-aware customers, and the global voluntary environmental initiatives. Industry has made great progress in its efforts to protect the environment and has spent hundreds of billions of dollars to decrease the release of toxic substances into the environment while also developing technologies to reduce or eliminate hazardous waste generation. Many industries, taking initiatives coupled with advances in technology, are changing the way of responding to their environmental obligations. The book provides information on a rational basis for air quality management and green belt development in urban areas. Techman, 2002
