Recent Progress in Slow Sand and Alternative Biofiltration Processes Rolf Gimbel, Nigel Graham, M. Robin Collins, 2006-03-31 Slow sand filtration is typically cited as being the first engineered process in drinking water treatment Proven modifications to the conventional slow sand filtration process the awareness of induced biological activity in riverbank filtration systems and the growth of oxidant induced biological removals in more rapid rate filters e.g biological activated carbon demonstrate the renaissance of biofiltration as a treatment process that remains viable for both small rural communities and major cities Biofiltration is expected to become even more common in the future as efforts intensify to decrease the presence of disease causing microorganisms and disinfection by products in drinking water to minimize microbial regrowth potential in distribution systems and where operator skill levels are emphasized Recent Progress in Slow Sand and Alternative Biofiltration Processes provides a state of the art assessment on a variety of biofiltration systems from studies conducted around the world The authors collectively represent a perspective from 23 countries and include academics biofiltration system users designers

and manufacturers It provides an up to date perspective on the physical chemical biological and operational factors affecting the performance of slow sand filtration SSF riverbank filtration RBF soil aquifer treatment SAT and biological activated carbon BAC processes The main themes are comparable overviews of biofiltration systems slow sand filtration process behavior treatment performance and process developments and alternative biofiltration process behaviors treatment performances and process developments
