Development of Biomass Gasification Technology in India Willem Christiaens,2010-09 This work analyses the development of biomass gasification in India where it takes off with presenting brief historical narrative of past experiments and commercial installations The analysis adopts the framework of Strategic Niche Management in its analysis and applies it to draw conclusions on the past and future development of the technology With the high expectations on the technology s applicability after the first lab scale experiments hundreds of small scale gasifiers where deployed throughout rural India with mixed success Previous expectations proved wrong and new applications for the technology where sought The technology demonstrated to be easier to use in the Industrial setting where it competed with diesel fired burners that gradually became expensive to operate due to increasing fossil fuel prices Also other niches where found for the technology to work in successfully such as crematoria The research is partially based on an 8 month field study where over 40 stakeholders have been interviewed and gasifier installations have been visited

Warnmer,2007 Like coal and petroleum biomass is a form of stored solar energy The energy of the sun is captured through the process of photosynthesis in growing plants Like all methods used to generate energy the combustion of biomass generates pollution as a by product One advantage of biofuel in comparison to most other fuel types is that the energy within the biomass can be stored for an indefinite amount of time without any danger Agricultural products specifically grown for use as biofuels include corn and soybeans primarily in the United States as well as flaxseed and rapeseed primarily in Europe and hemp is a growing crop around the world except for in America Waste from industry agriculture forestry and households can also be used to produce bioenergy examples include straw lumber manure sewage garbage and food leftovers Biomass used as fuel often consists of under utilised types like chaff and animal waste Much research is currently in progress into the utilisation of microalgae as an energy source with applications being developed for biodiesel ethanol methanol methane and even hydrogen On the rise is use of hemp although current politics restrains it This book presents the latest leading edge research in a field set to explode with growth **India, a Reference Annual** ,2003
