Brain-Computer Interfaces 1 Maureen Clerc,Laurent Bougrain,Fabien Lotte,2016-07-14 Brain computer interfaces BCI are devices which measure brain activity and translate it into messages or commands thereby opening up many investigation and application possibilities This book provides keys for understanding and designing these multi disciplinary interfaces which require many fields of expertise such as neuroscience statistics informatics and psychology This first volume Methods and Perspectives presents all the basic knowledge underlying the working principles of BCI It opens with the anatomical and physiological organization of the brain followed by the brain activity involved in BCI and following with information extraction which involves signal processing and machine learning methods BCI usage is then described from the angle of human learning and human machine interfaces The basic notions developed in this reference book are intended to be accessible to all readers interested in BCI whatever their background More advanced material is also offered for readers who want to expand their knowledge in disciplinary fields underlying BCI This first volume will be followed by a second volume entitled Technology and Applications **Decoding EEG Brain Signals using Recurrent Neural Networks** Juri Fedjaev,2019-01-14 Master s Thesis from the year 2017 in the subject Electrotechnology grade 1 0 Technical University of Munich Neurowissenschaftliche Systemtheorie language English abstract Brain computer interfaces BCIs based on electroencephalography EEG enable direct communication between humans and computers by analyzing brain activity Specifically modern BCIs are capable of translating imagined movements into real life control signals e g to actuate a robotic arm or prosthesis This type of BCI is already used in rehabilitation robotics and provides an alternative communication channel for patients suffering from amyotrophic lateral sclerosis or severe spinal cord injury Current state of the art methods are based on traditional machine learning which involves the identification of discriminative features This is a challenging task due to the non linear non stationary and time varying characteristics of EEG signals which led to stagnating progress in classification performance Deep learning alleviates the efforts for manual feature engineering through end to end decoding which potentially presents a promising solution for EEG signal classification This thesis investigates how deep learning

models such as long short term memory LSTM and convolutional neural networks CNN perform on the task of decoding motor imagery movements from EEG signals For this task both a LSTM and a CNN model are developed using the latest advances in deep learning such as batch normalization dropout and cropped training strategies for data augmentation Evaluation is performed on a novel EEG dataset consisting of 20 healthy subjects The LSTM model reaches the state of the art performance of support vector machines with a cross validated accuracy of 66.20% The CNN model that employs a time frequency transformation in its first layer outperforms the LSTM model and reaches a mean accuracy of 84.23% This shows that deep learning approaches deliver competitive performance without the need for hand crafted features enabling end to end classification
