Convolutional Neural Network in classifying scanned documents Tai Doan, 2016-12-30

Internship Report from the year 2016 in the subject Computer Science Applied University of Science and Technology of Hanoi course Internship language English abstract In this project I created and augmented a dataset from a number of given images to train and test convolutional neural network which is used to classify five classes of images of scanned documents In order to generate the dataset some image processing techniques were applied such as sliding window rotating flipping and pyramid sizing The result of this phase is a set of images having same size 244x224x3 These images after being labeled were divided into three dataset for training validating and testing the network The network is a simple convolution neural network which is also called LeNet It has three convolutional layers and one fully connected layer After being trained and

validated the best state of the network was pointed out and tested on the testing dataset and some real images The result showed that the LeNet was able to classify images of documents in a pretty high accuracy At the end of the project I modified the network and discussed the affect that those changes had on the network with the purpose of creating another similar network which can perform better than the original one The result proved that it worked a little better than its original version

Lattner,2007 Many domains feature a dynamic characteristic like logistics sports or medicine and it would be useful to learn about frequent patterns e g in what situations a traffic jam is likely to happen Additionally we are facing complex situations with many objects and relations that might change over time The learning approach developed in this work identifies frequent temporal patterns out of qualitative interval based descriptions of dynamic scenes by extending the Apriori algorithm and combining ideas from relational as well as sequential association rule mining approaches Temporal relations in patterns are represented by qualitative interval relations as they have been introduced by Allen and Freksa The search for frequent patterns is a top down approach starting by the most general empty pattern and performing specialization steps by applying an optimal refinement operator In a second step prediction rules are generated by splitting the identified patterns into precondition and consequence parts The developed concepts are implemented in the MiTemp system and are evaluated on synthetic data and soccer matches of the RoboCup simulation league
