Network Flows and Monotropic Optimization R. Tyrell Rockafellar, 1999-06-01 A rigorous and comprehensive treatment of network flow

theory and monotropic optimization by one of the world's most renowned applied mathematicians. This classic textbook covers extensively the duality theory and the algorithms of linear and nonlinear network optimization and their significant extensions to monotropic programming separable convex constrained optimization problems including linear programs. It complements our other book on the subject of network optimization: *Network Optimization: Continuous and Discrete Models* (Athena Scientific, 1998). Monotropic programming problems are characterized by a rich interplay between combinatorial structure and convexity properties. Rockafellar develops for the first time algorithms and a remarkably complete duality theory for these problems. Among its special features, the book: a) Treats in depth the duality theory for linear and nonlinear network optimization; b) Uses a rigorous step-by-step approach to develop the principal network optimization algorithms; c) Covers the main algorithms for specialized network problems such as max flow, feasibility, assignment, and shortest path; d) Develops in detail the theory of monotropic programming based on the author's highly acclaimed research; e) Contains many examples, illustrations, and exercises; f) Contains much new material not found in any other textbook.

Integer Programming and Network Flows. (2. Print.) Te Chiang Hu, 1969. The book consists of three parts: linear programming, network flows, and integer programming. Emphasis is placed on the algorithm, its proof, theory, and application. Much of the material is new, and numerous references are given to cover all aspects of the subject. Author: *Optimization and Mathematical Modeling in Computer Architecture* Karthikeyan Sankaralingam, Michael Ferris, Tony Nowatzki, Cristian Estan, Nilay Vaish, David Wood, 2022-05-31. In this book, we give an overview of modeling techniques used to describe computer systems to mathematical optimization tools. We give a brief introduction to various classes of mathematical optimization frameworks with special focus on mixed integer linear programming, which provides a good balance between solver time and expressiveness. We present four detailed case studies: instruction set customization, data center resource management, spatial architecture scheduling, and resource allocation in tiled architectures, showing how MILP can be used and quantifying by how much it outperforms traditional design exploration techniques. This book should help a skilled systems designer to learn techniques for using MILP in their problems and the skilled optimization expert to understand the types of computer systems problems that MILP can be applied to.
