Hands-On GPU Programming with Python and CUDA Dr. Brian Tuomanen, 2018-11-27 Build real world applications with Python 2.7, CUDA 9 and CUDA 10 We suggest the use of Python 2.7 over Python 3.x since Python 2.7 has stable support across all the libraries we use in this book Key Features Expand your background in GPU programming PyCUDA scikit-cuda and Nsight Effectively use CUDA libraries such as cuBLAS cuFFT and cuSolver Apply GPU programming to modern data science applications Book Description *Hands On GPU Programming with Python and CUDA* hits the ground running you'll start by learning how to apply Amdahl's Law use a code profiler to identify bottlenecks in your Python code and set up an appropriate GPU programming environment You'll then see how to query the GPU's features and copy arrays of data to and from the GPU's own memory As you make your way through the book you'll launch code directly onto the GPU and write full blown GPU kernels and device functions in CUDA C You'll get to grips with profiling GPU code effectively and fully test and debug your code using Nsight IDE Next you'll explore some of the more well known NVIDIA libraries such as cuFFT and cuBLAS With a solid background in place you will now apply your new found knowledge to develop your very own GPU based deep neural network from scratch You'll then explore advanced topics such as warp shuffling dynamic parallelism and PTX assembly In the final chapter you'll see some topics and applications related to GPU programming that you may wish to

pursue including AI graphics and blockchain By the end of this book you will be able to apply GPU programming to problems related to data science and high performance computing What you will learn Launch GPU code directly from Python Write effective and efficient GPU kernels and device functions Use libraries such as cuFFT cuBLAS and cuSolver Debug and profile your code with Nsight and Visual Profiler Apply GPU programming to datascience problems Build a GPU based deep neuralnetwork from scratch Explore advanced GPU hardware features such as warp shuffling Who this book is for Hands On GPU Programming with Python and CUDA is for developers and data scientists who want to learn the basics of effective GPU programming to improve performance using Python code You should have an understanding of first year college or university level engineering mathematics and physics and have some experience with Python as well as in any C based programming language such as C C Go or Java

Lessons Learned Using NVidia GPUs Within SAR Applications, 2012 Cuda Handbook Nicholas Wilt, 2017-07-05 GPUs can be used for much more than graphics processing As opposed to a CPU which can only run four or five threads at once a GPU is made up of hundreds or even thousands of individual low powered cores allowing it to perform thousands of concurrent operations Because of this GPUs can tackle large complex problems on a much shorter time scale than CPUs Dive into parallel programming on NVIDIA hardware with CUDA by Chris Rose and learn the basics of unlocking your graphics card This updated and expanded second edition of Book provides a user friendly introduction to the subject Taking a clear structural framework it guides the reader through the subject s core elements A flowing writing style combines with the use of illustrations and diagrams throughout the text to ensure the reader understands even the most complex of concepts This succinct and enlightening overview is a required reading for all those interested in the subject We hope you find this book useful in shaping your future career Business Performance Analysis of Memory Transfers and GEMM Subroutines on NVIDIA Tesla GPU Cluster, 2009 Commodity clusters augmented with application accelerators are evolving as competitive high performance computing systems The Graphical Processing Unit GPU with a very high arithmetic density and performance per price ratio is a good platform for the scientific application acceleration In addition to the interconnect bottlenecks among the cluster compute nodes the cost of memory copies between the host and the GPU device have to be carefully amortized to improve the overall efficiency of the application Scientific applications also rely on efficient implementation of the Basic Linear Algebra Subroutines BLAS among which the General Matrix Multiply GEMM is considered as the workhorse subroutine In this paper they study the performance of the memory copies and GEMM subroutines that are critical to port the computational chemistry algorithms to the GPU clusters To that end a benchmark based on the NetPIPE framework is developed to evaluate the latency and bandwidth of the memory copies between the host and the GPU device The performance of the single and double precision GEMM subroutines from the NVIDIA CUBLAS 2.0 library are studied The results have been compared with that of the BLAS routines from the Intel Math Kernel Library MKL to understand the computational trade offs The test bed is a Intel Xeon cluster equipped with NVIDIA Tesla GPUs
