Modeling Fractional Outcomes with GLSTM

Wenbin Liu, PhD, (Trent University)

March 20, 2020

Abstract

The generalized GLS (GLS) theory (with Gaussian distributional assumption) has been the top choice to model fractional outcomes in many business problems. However, it is controversially found to assume Gaussian distribution for a response variable in the (0, 1) range. In this paper, several existing techniques for fractional outcomes with their implementations in R/RN proved to be flawed through a later analysis according to modeling fractional outcome data of businesses. The purpose of this paper is to provide a relatively comprehensive survey of how to model fractional outcomes in the RAN and (non)linear and (non)normal distributions.

Keywords:

Fractional outcomes, Total model, GLS (Gaussian total Squared) regression, Fractional logit model, Beta regression, Dirichlet regression, Poisson models.

1. Introduction

In the financial services industry, we often observed business outcomes in model fractional outcomes in the range of (0, 1). For instance, at the end of an credit line, LCR (Loan Loss Ratio (Default)) measures the proportion of losses not recovered from a default borrower during the collection process, which is observed in the closed interval (0, 1). Another example is the corporate financial leverage ratio represented by the long term debt as a proportion of the combined fixed and long term debt and the equity.

Although several theories in statistical models for fractional outcomes have emerged during the past years, there is still no general agreement on either the distributional assumption or the modeling practice. (a) Considering the widespread model usage of the two sample GLS regression with Gaussian distributional assumption has remained the most popular method to model fractional outcomes due to the simplicity. However, the agreement with GLS regression suffers from a couple of important flaws: First and the most important of all, fractional outcomes in the (0, 1) interval are not defined on the whole real line and therefore shouldn't be considered normally distributed. Moreover, a statistical counter-evidence of fractional outcomes is that the observed is not independent of the mean. The existing, the empirical evidence on the most appropriate modeling practice of (0, 1), seems to imply that a form of non-normality.
