

Inventory Management Example Problems with Solutions

1. An auto parts supplier sells Hardy-brand batteries to car dealers and auto mechanics. The annual demand is approximately 1,200 batteries. The supplier pays \$28 for each battery and estimates that the annual holding cost is 30 percent of the battery's value. It costs approximately \$20 to place an order (managerial and clerical costs). The supplier currently orders 100 batteries per month.
 - a. Determine the ordering, holding, and total inventory costs for the current order quantity.
 - b. Determine the economic order quantity (EOQ).
 - c. How many orders will be placed per year using the EOQ?
 - d. Determine the ordering, holding, and total inventory costs for the EOQ. How has ordering cost changed? Holding cost? Total inventory cost?

Solution We are given the following information:

annual demand: $D = 1200$ batteries per year

item cost: $c = \$28$ per battery

holding cost: $H = ic = 0.30(28) = \$8.40$ per battery per year

order cost: $S = \$20$ per order

current order quantity: $Q = 100$ batteries

- a. The current ordering and holding costs are: $\frac{D}{Q}S + \frac{Q}{2}H = \frac{1200}{100}(20) + \frac{100}{2}(\$8.40) = 240 + 420 = \$660$.
- b. The EOQ is $Q^* = \sqrt{\frac{2DS}{H}} = \sqrt{\frac{2 \cdot 1200 \cdot 20}{8.40}} = 75.6 \rightarrow 76$ batteries.
- c. The company will place $\frac{D}{Q^*} = \frac{1200}{76} = 15.8$ orders per year.
- d. The new ordering and holding costs are: $\frac{D}{Q^*}S + \frac{Q^*}{2}H = \frac{1200}{76}(20) + \frac{76}{2}(\$8.40) = 315.79 + 319.20 = \634.99 . The company will save \$25.01 by using the EOQ.

2. Upon closer inspection, the supplier determines that the demand for batteries is normally distributed with mean 4 batteries per day and standard deviation 3 batteries per day. (The supplier is open 300 days per year.) It usually takes about 4 days to receive an order from the factory.
 - a. What is the standard deviation of usage during the lead time?
 - b. Determine the reorder point needed to achieve a service level of 95 percent.
 - c. What is the safety stock? What is the holding cost associated with this safety stock?
 - d. How would your analysis change if the service level changed to 98 percent?

Solution In addition to the information from the problem above, we are told:

average demand rate: $d = 4$ batteries per day

standard deviation of demand: $\sigma_d = 3$ batteries per day

lead time: $L = 4$ days

300 operating days per year

The International Conference on Production Research has a good tradition. The first Conference was held in Birmingham 1971 with 61 participants. With respect to the decision that the Conference should be held every second year, by this time the Conference has been held in the following countries: Birmingham 1971, UK; Copenhagen 1973, Denmark; Amhurst 1975, USA; Tokyo 1977, Japan; Amsterdam 1979, The Netherlands; Novi Sad 1981, Yugoslavia; Windsor 1983, Canada; Stuttgart 1985, Germany; and the next Conference will take place in Cincinnati 1987, USA. The number of submitted abstracts and papers was continuously increasing such that the Programme Committee of this actual 8th Conference on Production Research has been forced to introduce a further refereeing procedure. Each submitted abstract was presented to at least two referees. This

resulted not only in a reduction of the number of presented full papers and poster contributions but as the Programme Committee and the Editors hope it led also to a considerable increase in the scientific quality of this 8th International Conference on Production Research The preceding conference in Windsor Canada was dedicated to the topic Production Research as a Means of Productivity Improvement We don t believe that this statement has become untrue in the meanwhile
