Abiotic Stresses in Field Crops: Response, Impacts and Management under Climate Change Scenario Aliza Pradhan, Kamal Krishna Pal, Mahesh Kumar, Ashim Datta, Milan Kumar Lal, Md Khairul Alam, Basavaraj P. S., 2025-01-17
Agriculture is globally challenged by adverse environmental factors including drought heat waterlogging cold soil salinity and sodicity nutrient deficiency heavy metal contamination and other edaphic stresses These stresses impair plant functioning at multiple levels limiting plant development and crop productivity In the current climate change scenario the increase in frequency and intensity of these stresses is posing a serious threat to overall food and nutrition security Plants respond to these stresses through several tolerance mechanisms operating at molecular biochemical physiological or morpho anatomical levels depending on their developmental stage and type of species The cope up strategy also differs depending on abiotic stress type duration and intensity The extent to which these changes occur to counteract the impact of abiotic stresses as well as the pathways involved in plant acclimation is not fully understood An advance in understanding agricultural crops adaptation and tolerance mechanisms underlying trans generational effects epigenetic changes and stress memory will significantly help in comprehending the implications as well as devising mitigation strategies for sustainable agriculture and thus food security Additionally it is crucial to understand the interactions and impacts of combined stresses to efficiently advance the development of combined stress tolerant crops as well as devising mitigation strategies for various climatic stressors
