## Application / Function

Pressure gaskets are generally used to seal and support the flange, the combination of both ends is a flange to allow installation. These consist of a gasket and a flange seal. Flange is a pressure vessel application or all flanges are made specifically used to secure the gasket. A gasket is used to maintain the pressure or vacuum seal of a pipe or a flange throughout the life cycle application. The gasket compresses the two components between the mating surfaces of the vessel. This is done by creating uniform force to compress the gasket against the two components between the mating surfaces. If the gasket creates uniform force for uniform and consistent through the life of the application then would be secured the system.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has many requirements therefore that need the additional to determine the performance of what the gasket is required to do against the application.
