Sim-to-Real Framework: Deep Reinforcement Learning Based Autonomous Car Navigation Using Unity3D and ROS2 ,2023 **Reinforcement Learning Algorithms for Robotic Navigation in Dynamic Environments** Travis W. Hickey,2001 **Algorithms for Robust Autonomous Navigation in Human Environments** Michael F. Everett,2020 Today s robots are designed for humans but are rarely deployed among humans This thesis addresses problems of perception planning and safety that arise when deploying a mobile robot in human environments A first key challenge is that of quickly navigating to a human specified goal one with known semantic type but unknown coordinate in a previously unseen world This thesis formulates the contextual scene understanding problem as an image translation problem by learning to estimate the planning cost to go from aerial images of similar environments The proposed perception algorithm is united with a motion planner to reduce the amount of exploration time before finding the goal In dynamic human environments pedestrians also present several important technical challenges for the motion planning system This thesis contributes a deep reinforcement learning based RL formulation of the multiagent collision avoidance problem with relaxed assumptions on the behavior model and number of agents in the environment Benefits include strong performance among many nearby agents and the ability to accomplish long term autonomy in pedestrian rich environments These and many other state of the art robotics systems rely on Deep Neural Networks for perception and planning However blindly applying deep learning in safety critical domains such as those involving humans remains dangerous without formal guarantees on robustness For example small perturbations to sensor inputs are often enough to change network based decisions This thesis contributes an RL framework that is certified robust to uncertainties in the observation space **Autonomous Navigation of Mobile Robots** Dip Narayan Ray,2012-08 Mobile robots are being popular due to their extensive application in different hazardous

unapproachable areas such as outer space underwater explorations underground coal mines monitoring inspection in chemical toxic nuclear factories etc The conventional classical robotics may not serve the purpose well if these environments are totally unknown unpredictable even the programmer cannot imagine it In such cases robot learning may be the best option Learning from the past experiences is one such way for real time application of robots for completely unknown environments Reinforcement learning is one of the best learning methods for robots using a constant system environment interaction Both single and multi agent concepts are available for implementation of learning The current research work describes a multi agent based reinforcement learning using the concept of behaviour based robotics for autonomous exploration of mobile robots
