### Regulator

Regulators control output pressure in a system. Pressure in a system of lines acting over a specific amount of distance. These devices are fitted with mechanical components that react to changes in the downstream air pressure. The regulator allows to automatically maintain a constant output pressure when a pressure source as long as the input pressure remains greater than the regulated output pressure. The reading on the regulator control knob indicates the regulated or output pressure.

#### Note: Always use a

regulator with a pressure gauge to monitor and control the performance of a pneumatic system. Every pneumatic system should have a pressure relief valve to prevent over pressure conditions.

Always always utilize your pneumatic system. The regulator used in the 1/2" NPT 200 PSI 100 lbs. is with safety feature.

### Pressure Adjustment Knob

Turning this knob adjust downstream pressure. It is important to remember the air is being compressed. Lower the pressure for compressed air used in tools.

### Speed or Flow Valves

Flow valves control the speed of air flow within one of a pneumatic circuit or component. There is a measure of the volume of air moving through the valve or component over a period of time (flow) or instantaneous. Flow control is adjusted using the needle valve. Turning the needle valve clockwise increases the flow rate. The higher the flow rate, the faster the component will operate.

Note: Not to regulated air use directionally used flow slowly in the other direction.

The flow slowing air direction is done using a large spring contained on the valve. The regulated air flow direction is done with a small spring. Flow control is best accomplished by regulating the flow of air out of a circuit or component.
