[A Beam Steering System for a Small Lightweight Phased Array Antenna](#) George A. Hrivnak, Vincent J. Organic, ARMY ELECTRONICS COMMAND FORT MONMOUTH N.J., 1970. The use of digital control circuitry and reciprocal latching ferrite phase shifters can result in a significant reduction in the power drain of the beam steering electronics for phased array antenna systems. This report deals with the design of the beam steering electronics required for a small phased array antenna system utilizing 16 phase shifters. LSI large scale integration and MSI medium scale integration monolithic digital circuitry are used extensively throughout the beam steering system as a means of reducing the size, weight, and power drain and simplifying the overall interconnection wiring.

Author [An Automatic Beam Steering System for the NSLS X-17T Beam Line Using Closed Orbit Feedback](#), 1987. Initial observations of motion of the undulator radiation in the NSLS X-17T beam line clearly indicated that the beam had to be stabilized in both directions to be usable for the planned soft x-ray imaging experiments. The low frequency spectra of beam motion contained peaks in the range from dc to 60 Hz and at higher frequencies. A beam steering system employing closed orbit feedback has been designed and installed to stabilize the beam in both planes. In each plane of motion, beam position is measured with a beam position detector and a correction signal is fed

back to a local four magnet orbit bump to dynamically control the angle of the radiation at the source This paper describes the design and performance of the beam steering system [Optical Beam Steering Using a 2D MEMS Scanner](#) Yves Pétremand,2010 [Optical Beam Steering Using a 2D MEMS Scanner](#) **High Performance Integrated Beam-steering Techniques for Millimeter-wave Systems** Ahmed Shehata Mohamed Abdellatif,2015 Recently the research and development of low cost and highly efficient millimeter wave mmWave systems with beam steering capabilities have significantly advanced to address the ever increasing demand for future wireless ultra broadband applications These applications include but are not limited to automotive anti collision surveillance radar smart navigation systems improved wireless tracking satellite communication imaging 5G wireless communication and 60GHz multi gigabit wireless personal and local area network WPAN WLAN In general beam steering capability significantly relaxes the overall system power budget and minimizes the interference In communication applications it enhances the link robustness through multi path mitigation and increases the channel and the aggregated channel throughput by exploiting the spatial dimension In imaging radar systems beam steering is essential for achieving the required resolution angle of arrival In this work I have proven many beam steering advantages in this work through the development of a ray tracing based wireless channel model which has been used to extract the antenna system requirements and to quantitatively illustrate the usefulness of the presented beam steerable systems Despite the advantages it provides the realization of this electronic beam steerable mmWave antenna system is quite challenging In general the mmWave components design integration fabrication and testing processes are far more complex than their lower frequency counterparts This can be attributed to the significant losses and parasitics experienced at mmWave frequencies as well as the lack of reliable design models Systems with fully integrated on chip antennas and passives have been widely studied and presented at mmWave range however the performance low antenna gain high phase noise etc the cost die size is huge and thermal problems are still major issues for these systems Hybrid integration tackles these problems by combining a compact and low power consumption die or multiple dies with high performance off chip passives antenna feed network passive phase shifters resonators etc however this integration is costly In addition there is a challenge associated with the implementation of high performance components at mmWave range This is mainly due to the use of advanced non standard types of fabrication technologies and complex integration packaging techniques Investigation optimization development of a highly efficient and yet very low cost mmWave beam steering solution calls for a multi disciplinary approach which involves EM theory optimization techniques microwave circuits wireless communications Silicon micro fabrication layout design parasitics modeling extraction and MEMS technology The proposed study introduces a high performance beam steering mmWave antenna system along with its integration with the active components with special consideration to the fabrication cost The new high resistivity Silicon HRS dielectric waveguide DWG based platform which has recently been developed at CIARS Centre for Intelligent Antenna and Radio Systems is extended

**Control Techniques in Beam Steering and Vector Modulation Application** Jonathan Douglas Jerothe, 2017 In the modern world researchers are continuously looking for faster and more efficient forms of communications A need for the ability to maximize the channel bandwidth available while maximizing the signal to noise ratio will be critical in the years to come As the society becomes more dependent on wireless technology and communications the required data rates to sustain our needs will skyrocket in the coming years There are a number of emerging solutions to this problem one of which is to look to higher frequencies where more bandwidth is available due to a lack of use In order to achieve this solution a system must be built that can both achieve a higher range of frequencies without compromising the wireless fidelity of the signal being transmitted Over the years an attempt to solve this problem has come in the form of many different types of Beamforming Analog beamforming is the most basic form of beam steering and has the benefits of a maximized signal to noise ratio SNR While Digital beamforming is more flexible in allowing you to deal with different ranges of frequencies it however has an extremely high power usage that is currently expensive to be commercially viable This leads to the idea of creating way to induce both analog and digital beamforming into a single system A system which can have to flexibility to work in almost any frequency range offered by digital systems while achieving the same degree of accuracy and power that come with an analog system A commercially viable system efficiency would be able to satisfy the needs of growing demand by supplying a near limitless bandwidth supply with a high signal fidelity At the University of Delaware it is hoped that the Vector Modulator will be able to fulfill the technological demands of a growing world while being more economically friendly compared to competing ideas
