Financial Signal Processing and Machine Learning Ali N. Akansu, Sanjeev R. Kulkarni, Dmitry M. Malioutov, 2016-04-20

The modern financial industry has been required to deal with large and diverse portfolios in a variety of asset classes often with limited market data available. Financial Signal Processing and Machine Learning unifies a number of recent advances made in signal processing and machine learning for the design and management of investment portfolios and financial engineering. This book bridges the gap between these disciplines offering the latest information on key topics including characterizing statistical dependence and correlation in high dimensions, constructing effective and robust risk measures and their use in portfolio optimization and rebalancing. The book focuses on signal processing approaches to model return momentum and mean reversion, addressing theoretical and implementation aspects. It highlights the connections between portfolio theory, sparse learning and compressed sensing, sparse eigen portfolios, robust optimization, non-Gaussian data driven risk measures, graphical models, causal analysis through temporal causal modeling and large scale copula based approaches. Key features: Highlights signal processing and machine learning as key approaches to quantitative finance. Offers advanced mathematical tools for high dimensional portfolio construction, monitoring and post trade analysis problems. Presents portfolio theory, sparse learning and compressed sensing sparsity methods for investment portfolios including eigen portfolios, model return momentum, mean reversion and non-Gaussian data driven risk measures with real world applications of these techniques. Includes contributions from leading researchers and practitioners in both the signal and information processing communities and the quantitative finance community.

**Multiscale Financial Signal Processing and Machine Learning** Zhengde Zhao,2022 Financial time series such as market indices and asset prices are shown to be driven by multiscale factors ranging from long term market regimes to rapid fluctuations Multiscale analysis and signal processing not only reveal latent behaviors embedded in financial time series but also help machine learning prediction tasks In this thesis we focus on two different approaches tailored for daily and intraday financial time series respectively In the first study Hilbert Huang transform is applied to daily prices and index values to reveal the underlying multiscale dynamics In addition a novel machine learning framework is proposed for identifying useful predictive features An adaptive algorithm for highly nonstationary time series was introduced and applied to cryptocurrencies to show embedded structure and spectral properties In the second study we inspect the relations between statistical properties at different timescales with the application to intraday high frequency price data with noise Functions describing the multiscale behaviors of volatility and correlation are defined and computed using empirical data Models for high frequency price processes are proposed and compared against empirical observations

Stock Market Prediction and Efficiency Analysis using Recurrent Neural Network Joish Bosco, Fateh Khan, 2018-09-18 Project Report from the year 2018 in the subject Computer Science Technical Computer Science course Computer Science language English abstract Modeling and Forecasting of the financial market have been an attractive topic to scholars and researchers from various academic fields The financial market is an abstract concept where financial commodities such as stocks bonds and precious metals transactions happen between buyers and sellers In the present scenario of the financial market world especially in the stock market forecasting the trend or the price of stocks using machine learning techniques and artificial neural networks are the most attractive issue to be investigated As Giles explained financial forecasting is an instance of signal processing problem which is difficult because of high noise small sample size non stationary and non linearity The noisy characteristics mean the incomplete information gap between past stock trading price and volume with a future price The stock market is sensitive with the political and macroeconomic environment However these two kinds of information are too complex and unstable to gather The above information that cannot be included in features are considered as noise The sample size of financial data is determined by real world transaction records On one hand a larger sample size refers a longer period of transaction records on the other hand large sample size increases the uncertainty of financial environment during the 2 sample period In this project we use stock data instead of daily data in order to reduce the probability of uncertain noise and relatively increase the sample size within a certain period of time By non stationarity one means that the distribution of stock data is various during time changing Non linearity implies that feature correlation of different individual stocks is various Efficient Market Hypothesis was developed by Burton G Malkiel in 1991
