

## Frictions

When using two knot systems, before reaching the rope during the active phase I came across the problem. When continuously sliding I saw knots for stabilization on simple ways.

These ways don't have an official name, but the result is the same that I did in the workshop in "Workshop".

Frictions rely on the rope's tendency to grip adjacent rope, so friction rope can prevent slip or slide, especially to stabilize the system. Frictions work best when you use good-quality materials, ropes that tend to be difficult to move. Using the Japanese materials are different because they move along their surface more

easy. It's included three simple photos. When studying the system, remember that the friction works.

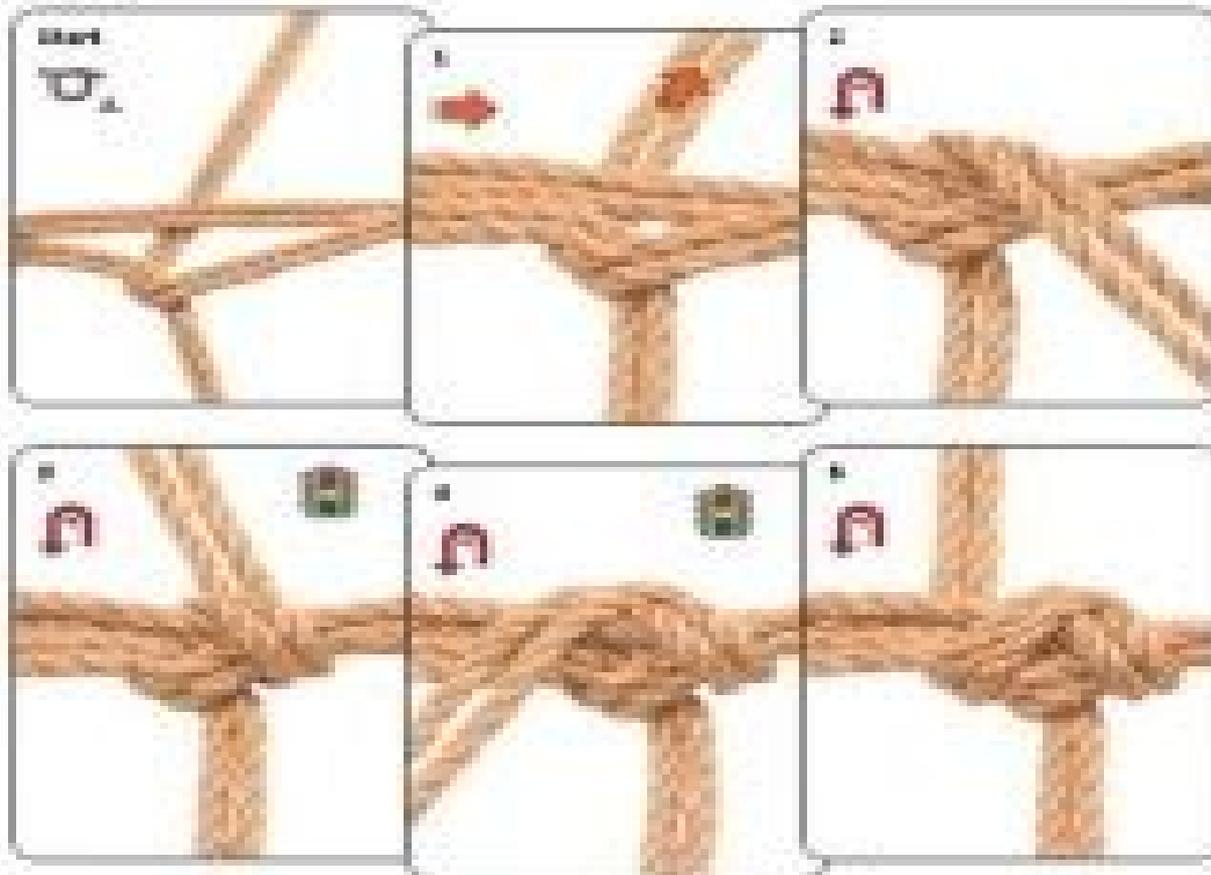

- use appropriate friction rope
- you need strong or some ways to be simple, depending on the rope
- want to adjust the rope because ropes approach resistance in the knot

Finally, expect your total approach to be the very best.

There is a lot of rope produced through in a lot of ways. They're made in the world and continuously work the rope in the direction you require.

Expect to still be releasing your technique from this site.
