Procedures for Structural Dynamics Eigenvalue Problems T sanhuei Hwang, 1991 Three multigrid algorithms are described that can solve the symmetric generalized eigenvalue problem encountered in structural dynamics First the multigrid algorithm for solving linear matrix equations is incorporated into the subspace iteration and block Lanczos methods to produce implicit subspace and Lanczos multigrid methods The nested iteration technique is adopted to produce the initial trial vectors Second the basic multigrid idea of fine mesh relaxation followed by a coarse mesh correction is explicitly applied to the eigenvalue problem to produce an explicit multigrid method The nested iteration technique is also used to provide information on the coarse meshes and to produce good initial approximations to the fine mesh eigensolutions Particular attention is paid to the implementation of these methods on vector and shared memory parallel supercomputers Several large scale problems are used to study the convergence behavior and computational performance of the methods The vector and parallel performance of the algorithms are tested using an Alliant FX 80 a Convex C240 and a Cray Y MP8 832 For example the first eigensolution of a plate problem with 3 151 875 degrees of freedom is solved in 670 seconds with 370 Mbytes of in core storage on the Convex In addition a computation rate of 950 Mflops and a speedup of 6 5 96 7% of parallelism are measured on the Cray **Structural Dynamics Solution Procedure for 2D Fluid-structure Interaction**

Simulation Joshua Evan Zorn, 2016 A new numerical technique for the solution of the structural dynamics equations of motion is presented The structural dynamics mass and momentum conservation equations are solved using a control volume technique which is second order accurate in space along with a dual time step scheme that is second order accurate in time The momentum conservation equation is written in terms of the Piola Kirchhoff stresses and the displacement velocity components The stress tensor is related to the Lagrangian strain and displacement tensors using the St Venant Kirchhoff constitutive relationship Source terms are included to account for surface pressure and body forces Verification of the structural dynamics solution procedure is presented for a two dimensional vibrating cantilever beam In addition the structural dynamics solution procedure has been implemented into a general purpose two dimensional conjugate heat transfer solution procedure that uses a similar dual time step control volume technique to solve the fluid mass energy and

Navier Stokes equations as well as the structural equation The resulting overall solution procedure allows for solutions to fluid structure interaction problems Verification of the multidisciplinary procedure is performed using a cylinder with a flexible solid protruding downstream that mimics a cylinder flag configuration Partitioned Methods of Solution for Structural Dynamics Systems Sukomal Modak,Elisa D.
