Lecture Notes: Engineering Optimization

Introduction:

- Optimization plays a crucial role in engineering design and decision-making processes.

- It involves finding the best solution among a set of possible alternatives.

- Engineering optimization aims to maximize performance, minimize costs, or achieve a balance between conflicting objectives.

- Optimization techniques help engineers make informed decisions, improve designs, and solve complex problems efficiently.

I. Fundamentals of Optimization

  A. Objective Function:

    1. Definition: A function that measures the performance or quality of a system or design.

    2. Examples: Cost function, efficiency function, reliability function.

  B. Design Variables:

    1. Parameters that define the system or design.

    2. Continuous variables (e.g., dimensions, material properties) or discrete variables (e.g., selection of components).

  C. Constraints:

    1. Limitations or conditions that must be satisfied by the design.

    2. Examples: Physical constraints, manufacturing constraints, safety constraints.

  D. Optimization Problem Formulation:

    1. Defining the objective function, design variables, and constraints.

    2. Mathematical representation of the optimization problem.

II. Single-Objective Optimization

  A. Unconstrained Optimization:

    1. Optimization without any constraints.

    2. Direct search methods (e.g., exhaustive search, golden section search).

    3. Gradient-based methods (e.g., steepest descent, Newton's method).
