Flight International ,1973 Diesel Engine Transient Operation Constantine D. Rakopoulos,Evangelos G. Giakoumis,2009-03-27 Traditionally the study of internal combustion engines operation has focused on the steady state performance However the daily driving schedule of automotive and truck engines is inherently related to unsteady conditions In fact only a very small portion of a vehicle s operating pattern is true steady state e g when cruising on a motorway Moreover the most critical conditions encountered by industrial or marine engines are met during transients too Unfortunately the transient operation of turbocharged diesel engines has been associated with slow acceleration rate hence poor driveability and overshoot in particulate gaseous and noise emissions Despite the relatively large number of published

papers this very important subject has been treated in the past scarcely and only segmentally as regards reference books Merely two chapters one in the book Turbocharging the Internal Combustion Engine by N Watson and M S Janota McMillan Press 1982 and another one written by D E Winterbone in the book The Thermodynamics and Gas Dynamics of Internal Combustion Engines Vol II edited by J H Horlock and D E Winterbone Clarendon Press 1986 are dedicated to transient operation Both books now out of print were published a long time ago Then it seems reasonable to try to expand on these pioneering works taking into account the recent technological advances and particularly the global concern about environmental pollution which has intensified the research on transient diesel engine operation typically through the Transient Cycles certification of new vehicles

Modelling Diesel Combustion P. A. Lakshminarayanan, Yogesh V. Aghav, 2022-01-21

This book comprehensively discusses diesel combustion phenomena like ignition delay fuel air mixing rate of heat release and emissions of smoke particulate and nitric oxide It enables quantitative evaluation of these important phenomena and parameters Most importantly it attempts to model them with constants that are independent of engine types and hence they could be applied by the engineers and researchers for a general engine This book emphasizes the importance of the spray at the wall in precisely describing the heat release and emissions for most of the engines on and off road It gives models for heat release and emissions Every model is thoroughly validated by detailed experiments using a broad range of engines The book describes an elegant quasi one dimensional model for heat release in diesel engines with single as well as multiple injections The book describes how the two aspects namely fuel injection rate and the diameter of the combustion bowl in the piston have enabled meeting advanced emission noise and performance standards The book also discusses the topics of computational fluid dynamics encompassing RANS and LES models of turbulence Given the contents this book will be useful for students researchers and professionals working in the area of vehicle engineering and engine technology This book will also be a good professional book for practising engineers in the field of combustion engines and automotive engineering

Combustion in a Swirl Chamber Diesel Engine Simulation by Computation of Fluid Dynamics Tim Sebastian Strauss, 1995

Simulation of the Diesel Engine Combustion Process Using the Stochastic Reactor Model Michal Pasternak, 2016 The present work is concerned with the simulation of combustion emission formation and fuel effects in Diesel engines The simulation process is built around a zero dimensional 0D direct injection stochastic reactor model DI SRM which is based on a probability density function PDF approach An emphasis is put on the modelling of mixing time to improve the representation of turbulence chemistry interactions in the 0D DI SRM The mixing time model describes the intensity of mixing in the gas phase for scalars such as enthalpy and species mass fraction On a crank angle basis it governs the composition of the gas mixture that is described by PDF distributions for the scalars The derivation of the mixing

time is based on an extended heat release analysis that has been fully automated using a genetic algorithm. The predictive nature of simulations is achieved through the parametrisation of the mixing time model with known engine operating parameters such as speed load and fuel injection strategy. It is shown that crank angle dependency of the mixing time improves the modelling of local inhomogeneity in the gas phase for species mass fraction and temperature. In combination with an exact treatment of the non linearity of reaction kinetics it enables an accurate prediction of the rate of heat release in cylinder pressure and exhaust emissions such as nitrogen oxides unburned hydrocarbons and soot from differently composed fuels. The method developed is particularly tailored for computationally efficient applications that focus on the details of reaction kinetics and the locality of combustion and emission formation in Diesel engines.

Development of a Partially Premixed Combustion Model for a Diesel Engine Using Multiple Injection Strategies Rene Thygesen, 2012 In order to fulfil future emissions legislations new combustion systems are to be investigated. One way of improving exhaust emissions is the application of multiple injection strategies and conventional or partially premixed combustion conditions to a Diesel engine. The application of numerical techniques as CFD supports and improves the quality of engine developments. Unfortunately current spray and combustion models are not accurate enough to simulate multiple injection systems being in this way a topic of research. The goal of this study was the development of a novel simulation method for the investigation of Diesel engines operated with multiple injection strategies and different combustion modes. The first part of this work focused in improving the spray modelling. The information of 3D CFD simulations of the injector nozzle was introduced in the spray simulation as boundary conditions developing coupling subroutines for this issue. The atomisation modelling was also improved using validated presumed droplet size distributions. Moreover to avoid the simulation of the injector nozzle for every investigated operating point a novel interpolating tool was developed in order to create spray boundary conditions based on few 3D CFD simulations of the nozzle under certain initial and boundary conditions. The second part of this thesis dealt with the combustion modelling of Diesel engines. For this issue a laminar flamelet approach called Representative Interactive Flamelet model RIF was selected and implemented. Afterwards an extended combustion model based on RIF was

developed in order to take into account multiple injection strategies Finally this new model was validated with a wide range of operating points applying multiple injection strategies under conventional and partially premixed combustion conditions

Simulation of Diesel Engine Air Flow G. Kibble,1970 **A Two-Stroke Diesel Engine Simulation Program** ,1990 A computer program simulating a two stroke diesel engine is developed and documented The program is suitable for simulating the diesel core of a high output combined cycle diesel engine The engine cylinder and the intake and exhaust ports are defined as independent thermodynamic systems and the mass energy equations for these systems are developed A single zone combustion model is used and perfect mixing during scavenging is assumed The program input requirements and output results are discussed A sample case is provided for an opposed piston uniflow scavenged two stroke diesel engine The mathematical model considers the thermodynamics and fluid mechanics of the working fluid from the entrance of the intake port to the exit of the exhaust port The program can predict the effect on engine performance of changes in parameters such as speed boost pressure valve timing and fueling level The program output provides information about power output brake mean effective pressure BMEP heat transfer losses and cylinder pressures and temperatures The program was written in modular form so that the submodels could be modified or replaced without requiring program alteration This report discusses the mathematical model used in the program and describes the subroutines that make up the model Input requirements are stated and the output listing is explained A sample program run is also provided
